

There is a huge opportunity for WISP's and the general public to benefit from unlicensed operations in the 3650-3700 MHz bands. Drive down the road in any city and you can detect the use of unlicensed frequencies (most notably 2.4Ghz) in almost 25% of every home and business you pass. More unlicensed spectrum is necessary to provide a foundation upon which services and equipment can grow to provide more opportunities for the general public and industry. Providing unlicensed spectrum in these bands will cause it to be more fully utilized than any other private or licensed use. Why waste it over a few when benefits could be reaped by all. Please open it up for unlicensed use. Thanks.
